

Relaxed plug-in sets and population identified sets

Simulation 1, true $h = 0.2$; means over 200 replications ($n = 4,000 + 2,000$ refreshment)

bar: relaxed plug-in set (trim at 10% of the mode, slack 0.10)

dark segment (open square: a single point): population identified set (Theorem 3)

dot: naive quantile-alignment estimate
